

Standard Operating Procedure (SOP): Campaign Order Intake & Data Management

Document Control Block

Document ID	Effective Date	Review Cycle	Version Control
SOP-ADV-OPS-001	May 29, 2026	Bi-Annual	v1.0 (Portfolio Baseline)
Prepared By	Reviewed By	Approved By	Department
Operations Executive	Senior Operations & MIS Manager	Head of Campaign Operations	Advertising & Marketing Ops

1. Objective & Scope

1.1 Objective: The primary objective of this Standard Operating Procedure (SOP) is to formalize the end-to-end operational workflow for ingest, cleanup, database mapping, and management reporting of client advertising space orders. This document enforces a rigorous methodology to convert non-standardized field data into clean, functional data sets, mitigating downstream campaign fulfillment errors and tracking critical Service Level Agreements (SLAs).

1.2 Scope: This procedure strictly applies to all inbound promotional, digital, billboard, and print campaign placements handled by the cross-functional operational team. It covers administrative data handling from order intake up to executive MIS dashboard presentation.

2. Prerequisites & Technical Infrastructure

- **Primary Software Platform:** Microsoft Excel (version 2019, 2021, or Office 365) / Google Sheets.
- **Core Target Files:** Advertising_Operations_System_2026.xlsx (incorporating the 100-row Master Order Sheet and the relational Vendor_Master relational table).
- **Required Access Rights:** Edit permissions for the Master Database; Read permissions

for Vendor directory assets.

3. Step-by-Step Operational Procedures

Step 3.1: Text Standardization & Data Normalization

1. **Category Normalization:** Insert an auxiliary column immediately adjacent to the raw Ad_Type field. Apply the formula =PROPER(C2) or =UPPER(C2) to force systematic text-casing compliance across the string categories (e.g., standardizing "digital", "DIGITAL", and "Digital" into a singular uniform category).
2. **Hard-coding Validated Strings:** Select the newly calculated array, execute a copy command, and perform a **Paste Special -> Values** operation directly over the original source column to strip out functional dependencies. Delete the auxiliary column.
3. **Geographic Grouping:** Invoke the Find & Replace interface (Ctrl + H). Audit the Country column. Locate variations of the local market syntax (e.g., "India") and systematically replace them with the standardized internal term **"Local"**. Retain foreign national identifiers (e.g., "USA", "UK", "Singapore") to preserve international operations segmentation.

Step 3.2: Chronological Formatting & SLA Turnaround Calculation

1. **Date String Resolution:** Highlight the Order_Date and Campaign_Deadline columns. Navigate to the **Data Ribbon** and select **Text to Columns**. Opt for the *Delimited* radio button, advance through the secondary window without delimiters, and on the final step select the **Date (DMY)** parser. Apply a universal structural format (DD-MM-YYYY) via cell formatting properties (Ctrl + 1).
2. **Timeline Delta Calculation:** Establish a new column labeled Available_Days positioned between the deadline metadata and financial metrics.
3. **Executing Formula:** Populate the cells with the deterministic delta formula:
`=Campaign_Deadline - Order_Date`
Change the data structure profile of this column to **General** or **Number** with zero decimals to derive an exact integer count of the days remaining for operational deployment.

Step 3.3: Relational Vendor Mapping via Advanced Lookup Formulas

1. **Data Isolation:** Verify the integrity of the secondary worksheet designated as Vendor_Master, which maps Vendor_Name explicitly against Vendor_Email and Operational_Tier.
2. **Dynamic Field Ingestion:** On the primary tracking worksheet, create a column header titled Vendor_Email. In cell E2 (or the corresponding first data row), introduce an

array-safe index formula:

```
=XLOOKUP(D2, Vendor_Master!A:A, Vendor_Master!B:B, "Email Missing", 0)
```

- 3. **Error Mitigation:** Ensure that any failed references resolve to a readable string alert rather than native database errors (such as #N/A). Extend this formula across the full 100-row volume.

Step 3.4: Financial Data Cleansing & Financial Formatting

- 1. **Numeric Transformation:** Isolate the Total_Cost_INR column. Strip non-numeric string delimiters by opening Find & Replace, inserting a single comma (,) into the search parameters, leaving the replacement field entirely blank, and triggering *Replace All*.
- 2. **Regional Currency Formatting:** Access the cell format console (Ctrl + 1), click on **Currency**, minimize decimal precision to 0, and bind the currency configuration to the Indian National Rupee symbol ₹ (**English - India**) to generate proper regional grouping visibility (Lakh/Crore system notation).

4. Quality Assurance Thresholds & Escalation Matrix

To maintain systemic accuracy and workflow control, the Operations Executive is bound to audit data boundaries against the following automated warning indicators:

Trigger Condition	Operational Risk Factor	Mandatory Executive Response
Available_Days < 5 Days	High SLA Breach Potential	Flag row using Light Red Fill and notify Senior Operations Manager via email within 2 hours.
Order_Status = "Delayed"	Client Dissatisfaction Risk	Extract Vendor_Email from lookup table, compose automated status update inquiry, and request revised timeline parameters.
Lookup Result = "Email Missing"	Broken Communication Supply Line	Halt processing, contact the procurement division to gather the official point of contact, and update Vendor_Master sheet.

5. Management Reporting & Dashboard Integrity

1. **Pivot Table Generation:** Construct an standalone sheet titled MIS_Dashboard. Aggregate row metrics by Order_Status and compile categorical budget summaries utilizing the Sum of Total_Cost_INR validation metric.
2. **Data Sync Protocol:** Prior to exporting the periodic summary metrics for executive review, click the ****Data**** ribbon and execute a ****Refresh All**** command to ensure the underlying pivot cache recalculates modified transactional data accurately.
